

(12) **United States Patent**
Williamson et al.

(10) **Patent No.:** **US 9,323,335 B2**
(45) **Date of Patent:** ***Apr. 26, 2016**

(54) **TOUCH EVENT MODEL PROGRAMMING INTERFACE**

(71) Applicant: **Apple Inc.**, Cupertino, CA (US)

(72) Inventors: **Richard Williamson**, Los Gatos, CA (US); **Gregory Dennis Bolsinga**, San Francisco, CA (US); **Timothy P. Omernick**, Mountain View, CA (US)

(73) Assignee: **APPLE INC.**, Cupertino, CA (US)

(*) Notice: Subject to any disclaimer, the term of this patent is extended or adjusted under 35 U.S.C. 154(b) by 264 days.

This patent is subject to a terminal disclaimer.

(21) Appl. No.: **13/791,621**

(22) Filed: **Mar. 8, 2013**

(65) **Prior Publication Data**

US 2013/0275888 A1 Oct. 17, 2013

Related U.S. Application Data

(63) Continuation of application No. 12/042,299, filed on Mar. 4, 2008, now Pat. No. 8,416,196.

(57) **ABSTRACT**

An electronic device receives touch input signals associated with a respective region of a web page. The respective region of the web page is associated with a plurality of event handlers or event listeners including an event handler or listener for a touch event and an event handler or listener for a gesture event. In response to receiving the touch input signals, the device sends a gesture event to the web page. The gesture event corresponds to a combination of two or more touch events, and the two or more touch events correspond to the touch input signals. The device dynamically rotates an element associated with the respective region of the web page with the event handler or listener for the gesture event based on a rotation value associated with the gesture event, and sends the touch events to the web page for processing, distinct from the dynamically rotating.

Office Action dated Oct. 19, 2010, received in German Patent Application No. 11 2009 000 001.0, which corresponds to U.S. Appl. No. 12/042,067, 5 pages (Williamson).

Office Action dated Sep. 26, 2012, received in German Patent Application No. 11 2009 000 001.0, which corresponds to U.S. Appl. No. 12/042,067, 5 pages (Williamson).

Office Action dated Oct. 15, 2010, received in European Patent Application No. 09 700 006.1, which corresponds to U.S. Appl. No. 12/042,067, 4 pages (Williamson).

Office Action dated Oct. 24, 2011, received in Japanese Patent Application No. 2010-502356, which corresponds to U.S. Appl. No. 12/042,067, 2 pages (Williamson).

Office Action dated Jan. 4, 2011, received in U.S. Appl. No. 12/042,299, 9 pages (Williamson).

Final Office Action dated Jul. 8, 2011, received in U.S. Appl. No. 12/042,299, 13 pages (Williamson).

Office Office Action dated May 3, 2012, received in U.S. Appl. No. 12/042,299, 14 pages (Williamson).

Notice of Allowance dated Dec. 12, 2012, received in U.S. Appl. No. 12/042,299, 2 pages (Williamson).

Office Action dated Oct. 26, 2011, received in Chinese Patent Application No. 200980000013.6, which corresponds to U.S. Appl. No. 12/042,299, 11 pages (Williamson).

Office Action dated Jun. 6, 2012, received in Chinese Patent Application No. 200980000013.6, which corresponds to U.S. Appl. No. 12/042,299, 7 pages (Williamson).

Office Action dated Dec. 5, 2012, received in Chinese Patent Application No. 200980000013.6, which corresponds to U.S. Appl. No. 12/042,299, 7 pages (Williamson).

Office Action dated August 10, 2010, received in German Patent Application No. 11 2009 000 003.7, which corresponds to U.S. Appl. No. 12/042,299, 3 pages (Williamson).

Office Action dated Sep. 26, 2012, received in German Patent Application No. 11 2009 000 003.7, which corresponds to U.S. Appl. No. 12/042,299, 5 pages (Williamson).

Office Action dated Nov. 26, 2010, received in European Patent Application No. 09 700 007.9, which corresponds to U.S. Appl. No. 12/402,299, 5 pages (Williamson).

Office Action dated Sep. 12, 2012, received in European Patent Application No. 11184226.6, which corresponds to U.S. Appl. No. 12/402,299, 5 pages (Williamson).

Office Action dated Sep. 12, 2012, received in European Patent Application No. 11184224.1, which corresponds to U.S. Appl. No. 12/402,299, 4 pages (Williamson).

Office Action dated Sep. 12, 2012, received in European Patent Application No. 11184223.3, which corresponds to U.S. Appl. No. 12/402,299, 4 pages (Williamson).

Office Action dated Sep. 12, 2012, received in European Patent Application No. 11184222.5, which corresponds to U.S. Appl. No. 12/402,299, 4 pages (Williamson).

Office Action dated Aug. 15, 2011, received in Japanese Patent Application No. 2010 502358, which corresponds to U.S. Appl. No. 12/042,299, 2 pages (Williamson).

Decision to Grant dated Mar. 23, 2012, received in Japanese Patent Application No. 2010-502358, which corresponds to U.S. Appl. No. 12/042,299, 5 pages (Williamson).

Office Action dated Jan. 3, 2013, received in U.S. Appl. No. 13/077,931, 24 pages (Shaffer).

Office Action dated Nov. 21, 2012, received in U.S. Appl. No. 13/163,624, 29 pages (Williamson).

Office Action dated Nov. 26, 2012, received in U.S. Appl. No. 13/163,626, 29 pages (Williamson).

Office Action dated Sep. 14, 2011, received in U.S. Appl. No. 12/042,237, 8 pages (Bolsinga).

Notice of Allowance dated Mar. 6, 2012, received in U.S. Appl. No. 12/042,237, 16 pages (Bolsinga).

Office Action dated Jul. 14, 2011, received in Chinese Patent Application No. 200980000015.5, which corresponds to U.S. Appl. No. 12/042,237, 8 pages (Bolsinga).

Office Action dated Feb. 22, 2012, received in Chinese Patent Application No. 200980000015.5, which corresponds to U.S. Appl. No. 12/042,237, 9 pages (Bolsinga).

Office Action dated Sep. 11, 2012, received in Chinese Patent Application No. 200980000015.5, which corresponds to U.S. Appl. No. 12/042,237, 9 pages (Bolsinga).

Office Action dated Sep. 26, 2012, received in German Patent Application No. 11 2009 000 002.9, which corresponds to U.S. Appl. No. 12/042,237, 5 pages (Bolsinga).

Office Action dated Jan. 16, 2012, received in Japanese Patent Application No. 2010-502357, which corresponds to U.S. Appl. No. 12/042,237, 2 pages (Bolsinga).

Notice of Allowance dated May 23, 2012, received in U.S. Appl. No. 13/221,830, 8 pages (Moore).

Notice of Allowance dated Dec. 3, 2012, received in U.S. Appl. No. 13/221,830, 17 pages (Moore).

Office Action dated Nov. 11, 2010, received in Chinese Patent Application No. 200880001827.7, which corresponds to U.S. Appl. No. 11/620,717, 6 pages (Platzer).

Office Action dated Jan. 29, 2012, received in Chinese Patent Application No. 2008800018227, which corresponds to U.S. Appl. No. 11/620,717, 5 pages (Platzer).

Office Action dated Jun. 20, 2012, received in U.S. Appl. No. 12/869,182, 18 pages (Platzer).

Notice of Allowance dated Dec. 12, 2012, received in U.S. Appl. No. 12/869,182, 8 pages (Platzer).

TOUCH EVENT MODEL PROGRAMMING INTERFACE

RELATED APPLICATIONS

This application is a continuation application of U.S. patent application Ser. No. 12/042,299, filed Mar. 4, 2008, which is incorporated herein by reference in its entirety.

This application is related to U.S. patent application Ser. No. 12/042,237, filed Mar. 4, 2008, and U.S. patent application Ser. No. 12/042,067, filed Mar. 4, 2008, the contents of which are herein incorporated by reference in their entirety.

TECHNICAL FIELD

This subject matter is generally related to web browsing services.

BACKGROUND

Web pages are created using a markup language which provides a means to describe a structure of text-based information in a document and to supplement that text with interactive forms, embedded images, and other objects. One popular markup language is HyperText Markup Language (HTML) which is written in the form of tags surrounded by angle brackets. HTML can describe the appearance and semantics of a web page, and can include embedded scripting language code (e.g., JavaScript®) which can affect the behavior of web browsers and other HTML processors. JavaScript® provides developers with the ability to add mouse event handlers or event listeners in a web page. These mouse event handlers can be assigned to specific regions of the web page and configured to receive mouse events in those regions, such as mouse up or mouse down events.

By contrast, web pages that are navigated with a touch sensitive device often need to respond to touch events generated by a user touching a web page with one or more fingers and making gestures. Conventional mouse event handlers cannot correctly interpret these touch events. Thus touch events require a different touch event model to correctly interpret touch events and to allow developers to fully utilize the capabilities of a touch sensitive display or device.

SUMMARY

One or more touch input signals can be obtained from a touch sensitive device. A touch event model can be used to determine touch and/or gesture events based on the touch input signals. The touch and gesture events can be associated with touch input signals generated from different regions of a web page displayed on the touch sensitive device. Access can be provided to at least one touch or gesture event through a programming interface.

In some implementations, in a web browser, a method comprising: receiving a rotation value associated with a gesture event; and dynamically rotating an element of a web page associated with the gesture event in the web browser based on the rotation value, wherein the rotation value is a relative delta in degrees. The gesture event can include two or more touch events.

In some implementations, in a web browser a method includes: receiving a scaling value associated with a gesture event; dynamically resizing an element of a web page associated with the gesture event in the web browser based on the

2

scaling value, wherein the scaling value is a relative delta in document pixels. The gesture event can be associated with two or more touch events.

In some implementations, in a web browser, a method includes: receiving a touch list, the touch list including touch data to identify one or more touches on a web page, wherein the touch data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes data to a touch event target associated with each touch, wherein the at least one set of touch location coordinates includes a set of client coordinates, a set of page coordinates, and a set of screen coordinates. The touch data can identify one or more changed touches.

Other implementations are disclosed which are directed to systems, methods and computer-readable mediums.

DESCRIPTION OF DRAWINGS

FIG. 1A illustrates an example web page document.

FIG. 1B illustrates an exemplary DOM associated with a web page.

FIG. 2 illustrates a processing stack of an example multi-touch capable device.

FIG. 3 is a flow diagram of an example process for processing touch events.

FIG. 4 illustrates an example multi-touch capable device.

FIG. 5 is a block diagram of an example network operating environment for the multi-touch capable device of FIG. 4.

FIG. 6 is a block diagram of an example implementation of the multi-touch capable device of FIG. 4.

DETAILED DESCRIPTION

Example Web Page Structure and DOM

FIG. 1A shows an example web page **100** that can be displayed on a browser. The browser may be hosted on a portable device, such as the multi-touch capable device **400** of FIG. 4. One or more elements, element **102** ("element 1"), element **104** ("element 2"), and element **106** ("element 3") can be displayed on the web page **100**. The elements **102**, **104**, **106** can correspond to regions of the web page **100** that a user can select and additional functionality can be provided as a result of the selection. The elements can, for example, correspond to buttons on the web page **100**. The elements can also be nested so that one element contains another element. For example, element **104** contains element **108**. In the example shown, the element **108** is a scrubber control nested within element **104** which can be a media player user interface, for example.

In some implementations, a user may perform various functions with the elements on the web page **100** using a finger instead of a mouse. The user can, for example, touch the elements of the web page **100** using the touch sensitive display **402** shown in FIG. 4. In one example, the user can select an element by touching the element with one or more fingers and/or making a gesture, such as a swiping, pinching or rotating motion. To recognize touch input signals, certain areas of the web page **100** may be associated with touch event handlers. This can be accomplished with a DOM and embedded scripting language, as will be described in reference to FIG. 1B.

FIG. 1B is an exemplary DOM **150** associated with the web page **100**. The DOM **150** provides a structural representation of the web page **100** and describes the web page content as a set of objects that a scripting language (e.g., JavaScript®) can interpret. In some implementations, the DOM **150** provides

access to the structure of a web page by mapping the elements **102**, **104**, **106**, **108** in the web page **100** to individual nodes of a tree. For example, element **102** corresponds to node **154**. Element **104** corresponds to node **156**. Element **106** corresponds to node **158**. Element **108** corresponds to node **160**. The root node **152** corresponds to the overall web page **100**.

In some implementations, one or more elements **102**, **104**, **106**, **108** in web page **100** can be associated with one or more corresponding touch event handler by associating corresponding nodes in the DOM **150** with the touch event handlers. Touch event handlers can be inserted into HTML tags of the web page **100** and can execute a scripting language to perform an action when, for example, a user touches or gestures within one of the elements on the web page **100**. For example, JavaScript® can work with the DOM **150** to attach actions to different touch events.

In some implementations, one or more elements **102**, **104**, **106**, **108** can receive touch input which is detected by an event handler or listener. The touch input can be detected and processed into touch events by a touch event model which can be implemented in one or more layers of a software stack, as described in reference to FIG. 2. The touch events can be further processed by the web page **100**. The touch events can be in a format (e.g., attributes) that are easier to use in an application than raw touch input signals generated by the touch sensitive device. For example, each touch event can include a set of coordinates at which a touch is currently occurring.

Each element in the web page **100**, and its associated event handler, can receive, process and handle touch events. For example, if driver **202** (FIG. 2) senses a touch point **110** associated with element **102**, or a touch point **112** associated with element **104**, the event handlers associated with elements **102** or **104** can each receive a separate touch event indicating that the element has been touched and can optionally send the touch event to the web page **100** for further processing. In some implementations, if a region of the web page **100** is touched that does not correspond to an event handler, a browser in the applications layer **214** can process the input, instead of the web page **100**.

In some implementations, a touch event can be detected per finger per node in the DOM **150**. For example, a user can touch the touch sensitive display **402** at touch point **110** and touch point **112** at substantially the same time, and two separate touch events can be detected by the touch event model. A separate touch event can be detected for touch point **110** and touch point **112** because each node **102** and node **104** in the DOM **150** are associated with a separate touch event handler.

In some implementations, touch events can be delivered to the web page **100** as EventTargets. Some examples of touch events can include touchstart, touchmove, touchend, and touchcancel. Other touch events are possible. Touchstart is a touch event that is detected when a user first places a finger on the touch sensitive display **402** in a region on the web page **100** that is associated with an event handler. When the user moves his finger around on the web page **100**, one or more touchmove events can be detected. When the user raises his finger off of the web page **100**, a touchend event is detected. The touchcancel can be detected when the system interrupts regular event handling. For example, a touchcancel event can occur when the touch sensitive display **402** is locked out to prevent inadvertent touches.

In some implementations, gesture events can also be detected by combining two or more touch events. Like touch events, the gesture events (GestureEvents) can also be delivered to the web page **100** as EventTargets. Some examples of gesture events can be gesturestart, gesturechange, and gesture-

reend. The gesture events can contain scale and/or rotation information. The rotation information can include a rotation value that is a relative delta in degrees. An element on the webpage **100** can be dynamically rotated based on the rotation value. The scale information can include a scaling value that is a relative delta in document pixels. An element on the webpage **100** associated with the gesture event can be dynamically resized based on the scaling value. Other gesture events are possible.

In some implementations, a touch list can be received that includes touch event data to identify one or more touches on the web page **100**. The touch event data can include a touch identifier and at least one set of touch location coordinates. The touch list can also include touch event data to a touch event target associated with each touch. In some implementations, the one set of touch location coordinates can include client coordinates, page coordinates, and screen coordinates. In some implementations, the touch event data can identify one or more changed touches.

In some implementations, GestureEvents can be sent to the web page **100** before TouchEvents. For example, if a user places fingers on touch point **110** and touch point **112**, then makes a rotating gesture with those fingers clockwise or counterclockwise on the touch sensitive display, the touch event model detects these multiple touch events and combines the touch events into a gesture event. The gesture event can then be sent to the web page **100**, followed by the touch events that were combined to form the gesture event. This way, a developer has access to a gesture event and the individual touch events of the gesture event which provides the developer with more flexibility when developing a web application.

In some implementations, the touch events are received in the following order: a touchstart event, one or more touchmove events and a touchend or touchcancel event. Using the example of FIG. 1A, when the user touches touch point **110**, a first touchstart event is detected by a first touch event handler associated with element **102**. When the user touches touch point **112**, a second touchstart event is detected by a second touch event handler associated with element **104**. As the user rotates her fingers without lifting her fingers, the first and second touch event handlers detect touchmove events which can be interpreted by the touch event model as a rotation gesture event. When the user finishes the rotation and lifts her fingers from the web page **100**, the first and second touch event handlers detect touchend events. All or some of these touch events can be made available to developers through a touch event Application Programming Interface (API). The touch API can be made available to developers as a Software Development Kit (SDK) or as part of an application (e.g., as part of a browser tool kit). The touch event API can rely on other services, frameworks and an operating system to perform its various functions. These services, frameworks and operating system can be part of a software or processing stack, as described in reference to FIG. 2, where the touch events are associated with attributes that can be inserted in documents to define event actions in an application.

Example IDL

An example touch event model will now be described in Interface Description Language (IDL). The functionality and data structures of the IDL can be accessed through an API by a web designer or application developer. Access to touch events and/or gesture events can be associated with attributes that can be inserted in a markup language document (e.g.,

HTML, XML) to define event actions in an application. For example, the attributes can be inserted in one or more HTML tags in an HTML document for generating the web page

displayed on the touch sensitive display 402. The event actions can include running an embedded script (e.g., JavaScript®).

```

interface [
    Conditional=TOUCH_EVENTS,
    GenerateConstructor
] TouchEvent : UIEvent {
    void initTouchEvent(in AtomicString type,
        in boolean canBubble,
        in boolean cancelable,
        in DOMWindow view,

```

```

    readonly attribute boolean ctrlKey;
    readonly attribute boolean shiftKey;
    readonly attribute boolean altKey;
    readonly attribute boolean metaKey;
};
In Document.idl:
Touch      createTouch(in EventTarget target,
                      in long identifier,
                      in long clientX,
                      in long clientY,
                      in long pageX,
                      in long pageY,
                      in long screenX,
                      in long screenY)
    raises (DOMException);
[Custom] TouchList createTouchList( )
    raises (DOMException);

```

The following is example of HTML code snippet for processing touch events using the example IDL above. The HTML below shows, for example, that the touch event listener TouchStart and GestureStart were added to an element with the HTML code:

```

this.element.addEventListener('touchstart',    function(e)
{return self.onTouchStart(e)}, false);
this.element.addEventListener('gesturestart',  function(e)
{return self.onGestureStart(e)}, false);

```

The HTML code corresponding to the IDL above may be as follows:

```

<!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd">

Example Processing Stack for Multi-Touch Device

FIG. 2 is a diagram of a processing stack of an example multi-touch capable device. The touch event model described above can be implemented in one or more regions of the processing stack and use various resources in the stack. The hardware **200** layer can include various hardware interface components, such as a touch sensitive or enabled device or touch sensitive display. The touch sensitive device can include a display and a panel that senses multiple touches

simultaneously. The hardware layer **200** can also include an accelerometer for detecting an orientation of the touch sensitive display or device (e.g., portrait, landscape). Thus signals indicative of orientation can be used by the touch event model to scale web pages for optimum display.

One or more drivers in a driver layer **202** can communicate with the hardware **200**. For example, the drivers can receive and process touch input signals generated by the touch sensitive display or device in the hardware layer **200**. A core Operating System (OS) **204** can communicate with the

13

driver(s). The core OS **204** can process raw input data received from the driver(s). In some embodiments, the drivers can be considered to be a part of the core OS **204**.

A set of OS application programming interfaces (APIs) **206** can communicate with the core OS **204**. These APIs can be a set of APIs that are usually included with operating systems (such as, for example, Linux or UNIX APIs). A set of core foundation APIs **208** can utilize the OS APIs **206**, and a set of foundation APIs **210** can utilize the core foundation APIs **208**.

Web page software development kit (SDK) **210** can include a set of APIs designed for use by applications running on the device. The touch event APIs can, for example, be included in the Web page SDK **210**. The APIs of the Web page SDK **210** can utilize the foundation APIs **208**. The Web page SDK **210** can, for example, include Web KIT provided by Apple Inc. The Web page SDK **210** can be offered as an API or can be accessible through an application, for example, a browser such as SAFARI®, provided by Apple Inc.

Applications **214** running on the device can utilize the APIs of the Web page SDK **210** to create web pages. The APIs of the Web page SDK **210** can, in turn, communicate with lower level elements, ultimately communicating with the touch sensitive display or device and various other user interface hardware. While each layer can utilize the layer underneath it, that is not always required. For example, in some embodiments, applications **214** can occasionally communicate with OS APIs **206**.

Example Touch Event Process

FIG. 3 is a flow diagram of a process **300** for providing access to touch and/or gesture events through an API. The process **300** can begin by obtaining one or more touch input signals (**302**). The touch input signals can be obtained from a touch sensitive display or device. A determination of touch events and/or gestures can be made based on the touch input signals using a touch event model (**304**). The touch events can be associated with regions of a web page displayed on a touch sensitive display or device. For example, the touch sensitive display can be a display on a mobile phone, and a touch sensitive device can be a touch sensitive pad on a notebook computer. Access to touch events and/or gesture events can be provided through a programming interface (**306**). For example, with respect to the HTML snippet described above with reference to FIG. 2, the snippet can be inserted into an HTML document by the web developer to provide the developer with access to touch and/or gesture events. The touch events and/or gesture events can be further processed by code in the HTML document to initiate event actions (**306**).

Mobile Device Overview

FIG. 4 is a block diagram of an example multi-touch capable device **400**. In some implementations, the multi-touch capable device **400** includes a touch sensitive display **402**. The touch sensitive display **402** can implement liquid crystal display (LCD) technology, light emitting polymer display (LPD) technology, or some other display technology. The touch sensitive display **402** can be sensitive to haptic and/or tactile contact with a user.

In some implementations, the touch sensitive display **402** can comprise a multi-touch sensitive display **402**. A touch sensitive display **402** can, for example, process multiple simultaneous touch points, including processing data related to the pressure, degree and/or position of each touch point. Such processing facilitates gestures and interactions with

14

multiple fingers, chording, and other interactions. Other touch sensitive display technologies can also be used, e.g., a display in which contact is made using a stylus or other pointing device. Some examples of multi-touch sensitive display technology are described in U.S. Pat. Nos. 6,323,846, 6,570,557, 6,677,932, and U.S. Patent Publication 2002/0015024A1, each of which is incorporated by reference herein in its entirety. In some implementations, the multi-touch capable device **400** can display one or more graphical user interfaces on the touch sensitive display **402** for providing the user access to various system objects and for conveying information to the user.

Example Multi-Touch Capable Device Functionality

In some implementations, the multi-touch capable device **400** can implement multiple device functionalities, such as a telephony device, an e-mail device, a network data communication device, a Wi-Fi base station device, and a media processing device. In some implementations, the multi-touch capable device **400** can include a web browser **404** for displaying web pages (e.g., web page **100**). The touch sensitive display **402** can receive touch input signals made on the web page **100** and the touch model described above can be used to determine touch and/or gesture events based on the touch input signals. In some implementations, the multi-touch capable device **400** can implement network distribution functionality. In some implementations, the touch sensitive display **402** can be locked down when the multi-touch capable device **400** is proximate to the user's ear. This lockdown would cause a touchcancel event as described in reference to FIG. 1B.

In some implementations, an accelerometer **472** can be utilized to detect movement of the multi-touch capable device **400**, as indicated by the directional arrow **474**. Accordingly, display objects and/or media can be presented according to a detected orientation, e.g., portrait or landscape. In some implementations, the multi-touch capable device **400** may include circuitry and sensors for supporting a location determining capability, such as that provided by the global positioning system (GPS) or other positioning systems (e.g., systems using Wi-Fi access points, television signals, cellular grids, Uniform Resource Locators (URLs)). In some implementations, a positioning system (e.g., a GPS receiver) can be integrated into the multi-touch capable device **400** or provided as a separate device that can be coupled to the multi-touch capable device **400** through an interface to provide access to location-based services. The multi-touch capable device **400** can also include one or more wireless communication subsystems.

In some implementations, a port device, e.g., a Universal Serial Bus (USB) port, or a docking port, or some other wired port connection, can be included. The port device can, for example, be utilized to establish a wired connection to other computing devices, such as other multi-touch capable devices **400**, network access devices, a personal computer, a printer, or other processing devices capable of receiving and/or transmitting data. In some implementations, the port device allows the multi-touch capable device **400** to synchronize with a host device using one or more protocols, such as, for example, the TCP/IP, HTTP, UDP and any other known protocol.

Network Operating Environment

FIG. 5 is a block diagram of an example network operating environment **600** for the multi-touch capable device **400** of FIG. 4. The multi-touch capable device **400** of FIG. 4 can, for

example, communicate over one or more wired and/or wireless networks **510** in data communication. For example, a wireless network **512**, e.g., a cellular network, can communicate with a wide area network (WAN) **514**, such as the Internet, by use of a gateway **516**. Likewise, an access point **518**, such as an 802.11g wireless access point, can provide communication access to the wide area network **514**. In some implementations, both voice and data communications can be established over the wireless network **512** and the access point **518**. For example, the multi-touch capable device **400a** can place and receive phone calls (e.g., using VoIP protocols), send and receive e-mail messages (e.g., using POP3 protocol), and retrieve electronic documents and/or streams, such as web pages, photographs, and videos, over the wireless network **512**, gateway **516**, and wide area network **514** (e.g., using TCP/IP or UDP protocols). Likewise, the multi-touch capable device **400b** can place and receive phone calls, send and receive e-mail messages, and retrieve electronic documents over the access point **518** and the wide area network **514**. In some implementations, the multi-touch capable device **400** can be physically connected to the access point **518** using one or more cables and the access point **518** can be a personal computer. In this configuration, the multi-touch capable device **400** can be referred to as a “tethered” device.

The multi-touch capable devices **400a** and **400b** can also establish communications by other means. For example, the multi-touch capable device **400a** can communicate with other wireless devices, e.g., other multi-touch capable devices **400**, cell phones, etc., over the wireless network **512**. Likewise, the multi-touch capable device **400a** and **400b** can establish peer-to-peer communications **520**, e.g., a personal area network, by use of one or more communication subsystems, such as the Bluetooth™ communication device **488** shown in FIG. 4. Other communication protocols and topologies can also be implemented.

The multi-touch capable device **400** can, for example, communicate with a network resource **530** over the one or more wired and/or wireless networks **510**. For example, the network resource can be a web server for delivering web pages which can be touched via the touch model, as described in reference to FIGS. 1-2.

Other services can also be provided, including a software update service that automatically determines whether software updates exist for software on the multi-touch capable device **400**, then downloads the software updates to the multi-touch capable device **400** where it can be manually or automatically unpacked and/or installed.

Example Mobile Device Architecture

FIG. 6 is a block diagram **600** of an example implementation of the multi-touch capable device **400** of FIG. 4. The multi-touch capable device **400** can include a memory interface **602**, one or more data processors, image processors and/or central processing units **604**, and a peripherals interface **606**. The memory interface **602**, the one or more processors **604** and/or the peripherals interface **606** can be separate components or can be integrated in one or more integrated circuits. The various components in the multi-touch capable device **400** can be coupled by one or more communication buses or signal lines.

Sensors, devices and subsystems can be coupled to the peripherals interface **606** to facilitate multiple functionalities. For example, a motion sensor **610**, a light sensor **612**, and a proximity sensor **614** can be coupled to the peripherals interface **606** to facilitate the orientation, lighting and proximity functions described with respect to FIG. 4. Other sensors **616**

can also be connected to the peripherals interface **606**, such as a positioning system (e.g., GPS receiver), a temperature sensor, a biometric sensor, or other sensing device, to facilitate related functionalities.

A camera subsystem **620** and an optical sensor **622**, e.g., a charged coupled device (CCD) or a complementary metal-oxide semiconductor (CMOS) optical sensor, can be utilized to facilitate camera functions, such as recording photographs and video clips.

Communication functions can be facilitated through one or more wireless communication subsystems **624**, which can include radio frequency receivers and transmitters and/or optical (e.g., infrared) receivers and transmitters. The specific design and implementation of the communication subsystem **624** can depend on the communication network(s) over which the multi-touch capable device **400** is intended to operate. For example, a multi-touch capable device **400** may include communication subsystems **624** designed to operate over a GSM network, a GPRS network, an EDGE network, a Wi-Fi or WiMax network, and a Bluetooth™ network. In particular, the wireless communication subsystems **624** may include hosting protocols such that the device **500** may be configured as a base station for other wireless devices.

An audio subsystem **626** can be coupled to a speaker **628** and a microphone **630** to facilitate voice-enabled functions, such as voice recognition, voice replication, digital recording, and telephony functions.

The I/O subsystem **640** can include a touch screen controller **642** and/or other input controller(s) **644**. The touch-screen controller **642** can be coupled to a touch screen **646**. The touch screen **646** and touch screen controller **642** can, for example, detect contact and movement or break thereof using any of a plurality of touch sensitivity technologies, including but not limited to capacitive, resistive, infrared, and surface acoustic wave technologies, as well as other proximity sensor arrays or other elements for determining one or more points of contact with the touch screen **646**.

The other input controller(s) **644** can be coupled to other input/control devices **648**, such as one or more buttons, rocker switches, thumb-wheel, infrared port, USB port, and/or a pointer device such as a stylus. The one or more buttons (not shown) can include an up/down button for volume control of the speaker **628** and/or the microphone **630**.

In one implementation, a pressing of the button for a first duration may disengage a lock of the touch screen **646**; and a pressing of the button for a second duration that is longer than the first duration may turn power to the multi-touch capable device **400** on or off. The user may be able to customize a functionality of one or more of the buttons. The touch screen **646** can, for example, also be used to implement virtual or soft buttons and/or a keypad or keyboard.

In some implementations, the multi-touch capable device **400** can present recorded audio and/or video files, such as MP3, AAC, and MPEG files. In some implementations, the multi-touch capable device **400** can include the functionality of an MP3 player, such as an iPod™. The multi-touch capable device **400** may, therefore, include a 32-pin connector that is compatible with the iPod. Other input/output and control devices can also be used.

The memory interface **602** can be coupled to memory **650**. The memory **650** can include high-speed random access memory and/or non-volatile memory, such as one or more magnetic disk storage devices, one or more optical storage devices, and/or flash memory (e.g., NAND, NOR). The memory **650** can store an operating system **652**, such as Darwin, RTXC, LINUX, UNIX, OS X, WINDOWS, or an embedded operating system such as VxWorks. The operating

system 652 may include instructions for handling basic system services and for performing hardware dependent tasks.

The memory 650 may also store communication instructions 654 to facilitate communicating with one or more additional devices, one or more computers and/or one or more servers. The memory 650 may include graphical user interface instructions 656 to facilitate graphic user interface processing; sensor processing instructions 658 to facilitate sensor-related processing and functions; phone instructions 660 to facilitate phone-related processes and functions; electronic messaging instructions 662 to facilitate electronic-messaging related processes and functions; web browsing instructions 664 to facilitate web browsing-related processes and functions; media processing instructions 666 to facilitate media processing-related processes and functions; GPS/Navigation instructions 668 to facilitate GPS and navigation-related processes and instructions; camera instructions 670 to facilitate camera-related processes and functions; and/or other messaging instructions 672 to facilitate processes and functions, as described in reference to FIGS. 1-5.

Each of the above identified instructions and applications can correspond to a set of instructions for performing one or more functions described above. These instructions need not be implemented as separate software programs, procedures or modules. The memory 650 can include additional instructions or fewer instructions. Furthermore, various functions of the multi-touch capable device 400 may be implemented in hardware and/or in software, including in one or more signal processing and/or application specific integrated circuits.

The features described can be implemented in digital electronic circuitry, or in computer hardware, firmware, software, or in combinations of them. The features can be implemented in a computer program product tangibly embodied in an information carrier, e.g., in a machine-readable storage device or in a propagated signal, for execution by a programmable processor; and method steps can be performed by a programmable processor executing a program of instructions to perform functions of the described implementations by operating on input data and generating output.

The described features can be implemented advantageously in one or more computer programs that are executable on a programmable system including at least one programmable processor coupled to receive data and instructions from, and to transmit data and instructions to, a data storage system, at least one input device, and at least one output device. A computer program is a set of instructions that can be used, directly or indirectly, in a computer to perform a certain activity or bring about a certain result. A computer program can be written in any form of programming language (e.g., Objective-C, Java), including compiled or interpreted languages, and it can be deployed in any form, including as a stand-alone program or as a module, component, subroutine, or other unit suitable for use in a computing environment.

Suitable processors for the execution of a program of instructions include, by way of example, both general and special purpose microprocessors, and the sole processor or one of multiple processors or cores, of any kind of computer. Generally, a processor will receive instructions and data from a read-only memory or a random access memory or both. The essential elements of a computer are a processor for executing instructions and one or more memories for storing instructions and data. Generally, a computer will also include, or be operatively coupled to communicate with, one or more mass storage devices for storing data files; such devices include magnetic disks, such as internal hard disks and removable disks; magneto-optical disks; and optical disks. Storage devices suitable for tangibly embodying computer program

instructions and data include all forms of non-volatile memory, including by way of example semiconductor memory devices, such as EPROM, EEPROM, and flash memory devices; magnetic disks such as internal hard disks and removable disks; magneto-optical disks; and CD-ROM and DVD-ROM disks. The processor and the memory can be supplemented by, or incorporated in, ASICs (application-specific integrated circuits).

To provide for interaction with a user, the features can be implemented on a computer having a display device such as a CRT (cathode ray tube) or LCD (liquid crystal display) monitor for displaying information to the user and a keyboard and a pointing device such as a mouse or a trackball by which the user can provide input to the computer.

The features can be implemented in a computer system that includes a back-end component, such as a data server, or that includes a middleware component, such as an application server or an Internet server, or that includes a front-end component, such as a client computer having a graphical user interface or an Internet browser, or any combination of them. The components of the system can be connected by any form or medium of digital data communication such as a communication network. Examples of communication networks include, e.g., a LAN, a WAN, and the computers and networks forming the Internet.

The computer system can include clients and servers. A client and server are generally remote from each other and typically interact through a network. The relationship of client and server arises by virtue of computer programs running on the respective computers and having a client-server relationship to each other.

A number of implementations have been described. Nevertheless, it will be understood that various modifications may be made. For example, elements of one or more implementations may be combined, deleted, modified, or supplemented to form further implementations. As yet another example, the logic flows depicted in the figures do not require the particular order shown, or sequential order, to achieve desirable results. In addition, other steps may be provided, or steps may be eliminated, from the described flows, and other components may be added to, or removed from, the described systems. Accordingly, other implementations are within the scope of the following claims.

What is claimed is:

1. A method performed by a device that includes one or more processors and memory storing one or more instructions for execution by the one or more processors, the method comprising:

receiving touch input signals associated with a respective region of a web page, wherein the respective region of the web page is associated with a plurality of event handlers or event listeners including an event handler or listener for a touch event and an event handler or listener for a gesture event; and

in response to receiving the touch input signals:

sending a gesture event to the web page, the gesture event corresponding to a combination of two or more touch events, the two or more touch events corresponding to the touch input signals;

dynamically rotating an element associated with the respective region of the web page with the event handler or listener for the gesture event based on a rotation value associated with the gesture event; and

sending the touch events to the web page for processing, the processing distinct from the dynamically rotating.

2. The method of claim 1, wherein the rotation value is a relative delta in degrees.

19

3. The method of claim 1, wherein the processing includes moving the element associated with the respective region of the web page.

4. The method of claim 1, wherein a respective touch event includes a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

5. A method performed by a device that includes one or more processors and memory storing one or more instructions for execution by the one or more processors, the method comprising:

receiving touch input signals associated with a respective region of a web page, wherein the respective region of the web page is associated with a plurality of event handlers or event listeners including an event handler or listener for a touch event and an event handler or listener for a gesture event; and

in response to receiving the touch input signals:

sending a gesture event to the web page, the gesture event corresponding to a combination of two or more touch events, the two or more touch events corresponding to the touch input signals;

dynamically resizing an element associated with the respective region of the web page with the event handler or listener for the gesture event based on a scaling value associated with the gesture event; and

sending the touch events to the web page for processing, the processing distinct from the dynamically resizing.

6. The method of claim 5, wherein the scaling value is a relative delta in document pixels.

7. The method of claim 5, wherein the processing includes moving the element associated with the respective region of the web page.

8. The method of claim 5, wherein a respective touch event includes a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

9. A method performed by a device that includes one or more processors and memory storing one or more instructions for execution by the one or more processors, the method comprising:

receiving a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

10. The method of claim 9, wherein the touch event data identifies one or more changed touches.

11. A non-transitory computer-readable medium having instructions stored thereon, which, when executed by one or more processors of a device, cause the device to perform operations comprising:

20

receiving touch input signals associated with a respective region of a web page, wherein the respective region of the web page is associated with a plurality of event handlers or event listeners including an event handler or listener for a touch event and an event handler or listener for a gesture event; and

in response to receiving the touch input signals:

sending a gesture event to the web page, the gesture event corresponding to a combination of two or more touch events, the two or more touch events corresponding to the touch input signals;

dynamically rotating an element associated with the respective region of the web page with the event handler or listener for the gesture event based on a rotation value associated with the gesture event; and

sending the touch events to the web page for processing distinct from the dynamically rotating.

12. The computer-readable medium of claim 11, wherein the rotation value is a relative delta in degrees.

13. The computer-readable medium of claim 11, wherein the processing includes moving the element associated with the respective region of the web page.

14. The computer-readable medium of claim 11, wherein a respective touch event includes a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

15. A non-transitory computer-readable medium having instructions stored thereon, which, when executed by one or more processors of a device, cause the device to perform operations comprising:

receiving touch input signals associated with a respective region of a web page, wherein the respective region of the web page is associated with a plurality of event handlers or event listeners including an event handler or listener for a touch event and an event handler or listener for a gesture event; and

in response to receiving the touch input signals:

sending a gesture event to the web page, the gesture event corresponding to a combination of two or more touch events, the two or more touch events corresponding to the touch input signals;

dynamically resizing an element associated with the respective region of the web page with the event handler or listener for the gesture event based on a scaling value associated with the gesture event; and

sending the touch events to the web page for processing distinct from the dynamically resizing.

16. The computer-readable medium of claim 15, wherein the scaling value is a relative delta in document pixels.

17. The computer-readable medium of claim 15, wherein the processing includes moving the element associated with the respective region of the web page.

18. The computer-readable medium of claim 15, wherein a respective touch event includes a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

21

19. A non-transitory computer-readable medium having instructions stored thereon, which, when executed by one or more processors of a device, cause the device to perform operations comprising:

receiving a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

20. The computer-readable medium of claim 19, wherein the touch event data identifies one or more changed touches.

21. An electronic device, comprising:

one or more processors; and

memory storing one or more programs for execution by the one or more processors, the one or more programs including instructions for:

receiving touch input signals associated with a respective region of a web page, wherein the respective region of the web page is associated with a plurality of event handlers or event listeners including an event handler or listener for a touch event and an event handler or listener for a gesture event; and

in response to receiving the touch input signals:

sending a gesture event to the web page, the gesture event corresponding to a combination of two or more touch events, the two or more touch events corresponding to the touch input signals;

dynamically rotating an element associated with the respective region of the web page with the event handler or listener for the gesture event based on a rotation value associated with the gesture event; and

sending the touch events to the web page for processing, the processing distinct from the dynamically rotating.

22. The device of claim 21, wherein the rotation value is a relative delta in degrees.

23. The device of claim 21, wherein the processing includes moving the element associated with the respective region of the web page.

24. The device of claim 21, wherein a respective touch event includes a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

25. An electronic device, comprising:

one or more processors; and

memory storing one or more programs for execution by the one or more processors, the one or more programs including instructions for:

receiving touch input signals associated with a respective region of a web page, wherein the respective region of the web page is associated with a plurality of event handlers or event listeners including an event handler or listener for a touch event and an event handler or listener for a gesture event; and

in response to receiving the touch input signals:

sending a gesture event to the web page, the gesture event corresponding to a combination of two or

22

more touch events, the two or more touch events corresponding to the touch input signals;

dynamically resizing an element associated with the respective region of the web page with the event handler or listener for the gesture event based on a scaling value associated with the gesture event; and sending the touch events to the web page for processing, the processing distinct from the dynamically resizing.

26. The device of claim 25, wherein the scaling value is a relative delta in document pixels.

27. The device of claim 25, wherein the processing includes moving the element associated with the respective region of the web page.

28. The device of claim 25, wherein a respective touch event includes a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

29. An electronic device, comprising:

one or more processors; and

memory storing one or more programs for execution by the one or more processors, the one or more programs including instructions for:

receiving a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

30. The device of claim 29, wherein the touch event data identifies one or more changed touches.

31. An electronic device, comprising:

one or more processors; and

memory storing one or more programs for execution by the one or more processors, the one or more programs including instructions for:

receiving touch input signals associated with a respective region of a web page, wherein the respective region of the web page is associated with a plurality of event handlers or event listeners including an event handler or listener for a touch event and an event handler or listener for a gesture event; and

in response to receiving the touch input signals:

generating two or more touch events based on the touch input signals;

generating a gesture event by combining the touch events;

sending the gesture event to the web page;

dynamically rotating an element associated with the respective region of the web page with the event handler or listener for the gesture event based on a rotation value associated with the gesture event; and

sending the touch events to the web page for processing, the processing distinct from the dynamically rotating.

32. The device of claim 31, wherein the rotation value is a relative delta in degrees.

23

33. The device of claim 31, wherein the processing includes moving the element associated with the respective region of the web page.

34. The device of claim 31, wherein a respective touch event includes a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

35. An electronic device, comprising:

one or more processors; and

memory storing one or more programs for execution by the one or more processors, the one or more programs including instructions for:

receiving touch input signals associated with a respective region of a web page, wherein the respective region of the web page is associated with a plurality of event handlers or event listeners including an event handler or listener for a touch event and an event handler or listener for a gesture event; and

in response to receiving the touch input signals:

generating two or more touch events based on the touch input signals;

generating a gesture event by combining the touch events;

sending the gesture event to the web page;

dynamically resizing an element associated with the respective region of the web page with the event handler or listener for the gesture event based on a scaling value associated with the gesture event; and

24

sending the touch events to the web page for processing, the processing distinct from the dynamically rotating.

36. The device of claim 35, wherein the scaling value is a relative delta in document pixels.

37. The device of claim 35, wherein the processing includes moving the element associated with the respective region of the web page.

38. The device of claim 35, wherein a respective touch event includes a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with a respective touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

39. An electronic device, comprising:

one or more processors; and

memory storing one or more programs for execution by the one or more processors, the one or more programs including instructions for:

receiving a touch list, the touch list including touch event data to identify one or more touches on a web page, wherein the touch event data includes a touch identifier and at least one set of touch location coordinates, wherein the touch list further includes a touch event target associated with each touch, wherein the at least one set of touch location coordinates includes at least one of client coordinates, page coordinates, and screen coordinates.

40. The device of claim 39, wherein the touch event data identifies one or more changed touches.
